

# Force Analysis Worksheet

## Using Free-Body Diagrams to Apply Newton's Laws

Purpose of the lab: To learn to analyze an object's motion by isolating it and showing all forces acting on it.

Note: This is an *extensive* take-home exercise—be sure to make plenty of time to complete it.

Materials needed: A ruler or other straight edge may be handy. No extra paper is needed—write on the pages provided.

Directions: For each situation,

1. **Using the given sketch (or create your own, as necessary), identify the nature and direction of all forces acting on the mass.** If you don't know a direction, make your best guess.
2. **Choose (and indicate) your coordinate system.** If the mass is known to be accelerating in a certain direction, choose a coordinate system so that one of its axes aligns with the direction of that acceleration.
3. **Draw a free-body diagram (FBD) showing all forces acting on the object.** Label all forces with variables, not numbers. Draw all force vectors with their tails beginning at the same place (use just a tiny box to represent the object in question—regardless of the actual shape of the object). Indicate any reference angles that will be used to resolve a vector into its  $x$ - and  $y$ - components. (Do not draw any acceleration vector on the free-body diagram. This is a force diagram.)
4. **Use Newton's 2nd Law to write equations for  $x$ - and  $y$ - directions.** You do not need to solve these equations. In writing each equation, don't plug in any numbers except zero. Just sum the forces on the left-hand side. Write the  $x$ - and  $y$ - components of a vector in terms of its magnitude and an angle. Also, use the expressions you know for weight ( $F_G = mg$  and friction ( $F_s^{max} = \mu_s F_N$  or  $F_k = \mu_k F_N$ ) whenever applicable.
5. **Some situations involve more than one object. Do the above four steps separately for each object.**

*The next page shows a complete example. ----->*

**EXAMPLE:** Masses  $m_1$  and  $m_2$  are stacked and accelerating together down the inclined surface. Force  $F$  is horizontal. The coefficient of kinetic friction between the surface and  $m_1$  is  $\mu_k$ . The coefficient of static friction between  $m_1$  and  $m_2$  is  $\mu_s$  (and assume that  $m_2$  is about to slip). Analyze all forces on each mass.

"Gravity exerts a vertical weight force on each mass."

Some direction guesses:

"The friction force by  $m_2$  on  $m_1$  ( $F_{s21}^{max}$ ) is down the slope. The friction force by the surface on  $m_1$  is up the slope."

FBD of  $m_1$

coord. axes

x-analysis

$$\Sigma F_x = m_1 a_x$$

$$F_{s21}^{max} + F_{G,1,x} - F_k = m_1 a_x$$

$$\mu_s F_{N21} + m_1 g \sin \theta - \mu_k F_N = m_1 a$$

y-analysis

$$\Sigma F_y = m_1 a_y$$

$$F_N - F_{N21} - F_{G,1,y} = m_1 a_y$$

$$F_N - F_{N21} - m_1 g \cos \theta = 0$$

The three equation forms shown are required for each analysis. Notice how you add more detail to the equation in each form. And notice how your choice of coordinate system here allows you to write  $a_x$  as just a (the total acceleration), because  $a_y$  is 0.

Notation examples:

$F_{N12}$  is "the normal force exerted by  $m_1$  on  $m_2$ ."

$F_{s21}^{max}$  is "the maximum static friction force that can be exerted by  $m_2$  on  $m_1$ ."

$F_k$  is "the kinetic friction force exerted by the surface (on the object it's touching)."

FBD of  $m_2$

coord. axes

x-analysis

$$\Sigma F_x = m_2 a_x$$

$$F_x + F_{G,2,x} - F_{s12}^{max} = m_2 a_x$$

$$F \cos \theta + m_2 g \sin \theta - \mu_s F_{N12} = m_2 a$$

y-analysis

$$\Sigma F_y = m_2 a_y$$

$$F_{N12} + F_y - F_{G,2,y} = m_2 a_y$$

$$F_{N12} + F \sin \theta - m_2 g \cos \theta = 0$$

**EXERCISE 1:** Masses  $m_1$  and  $m_2$  are stacked together, at rest, on a level surface. Analyze all forces on each mass.

*FBD of  $m_1$*

*coord. axes*

*x-analysis*

*y-analysis*

*FBD of  $m_2$*

*coord. axes*

*x-analysis*

*y-analysis*

**EXERCISE 2:** Masses  $m_1$  and  $m_2$  are stacked together on the level floor of an elevator. The masses are at rest with respect to each other and to the elevator. The elevator is accelerating upward. Analyze all forces on each mass.

*coord. axes*

*FBD of  $m_1$*

*x-analysis*

*y-analysis*

*FBD of  $m_2$*

*coord. axes*

*x-analysis*

*y-analysis*

**EXERCISE 3:** A person ( $m_2$ ) is standing on a bathroom scale ( $m_1$ ) on the level floor of an elevator. The person and scale are at rest with respect to each other and to the elevator. The elevator is accelerating downward. Analyze all forces on the person and scale.

**EXERCISE 4** (*make your own sketch*): A skydiver ( $m$ ) is falling with his parachute opened. His speed is decreasing. The total tension force exerted on him by the parachute is  $F_T$ . Analyze all forces on the skydiver only.

*FBD of  $m$*

*coord. axes*

*x-analysis*

*y-analysis*

**EXERCISE 5:** The block ( $m$ ) is accelerating to the right on a level, frictionless surface. Analyze all forces on the block.

*FBD of  $m$*

*coord. axes*

*x-analysis*

*y-analysis*

**EXERCISE 6:** The block ( $m$ ) is being pulled to the right with constant velocity, across a level surface with friction (its coefficient of kinetic friction =  $\mu_k$ ). Analyze all forces on the block.

*FBD of m*

*coord. axes*

*x-analysis*

*y-analysis*

**EXERCISE 7:** The block ( $m$ ) is at rest on a level surface with friction (coefficient of static friction =  $\mu_s$ ). Analyze all forces on the block.

*FBD of m*

*coord. axes*

*x-analysis*

*y-analysis*

**EXERCISE 8:** Masses  $m_1$  and  $m_2$  are suspended by three different wires of negligible mass. Analyze all forces on each mass.

*FBD of  $m_1$*

*coord. axes*

*x-analysis*

*y-analysis*

*FBD of  $m_2$*

*coord. axes*

*x-analysis*

*y-analysis*

**EXERCISE 9:** Masses  $m_1$  and  $m_2$  are stacked together on a level surface that has friction (its coefficient of kinetic friction =  $\mu_k$ ). The blocks are accelerating together to the right. There is static friction between the two blocks (its coefficient of static friction =  $\mu_s$ ). Analyze all forces on each block.

*FBD of  $m_1$*

*coord. axes*

*x-analysis*

*y-analysis*

*FBD of  $m_2$*

*coord. axes*

*x-analysis*

*y-analysis*

**EXERCISE 10:** Blocks  $m_1$  and  $m_2$  are accelerating together to the left on a level surface that has friction (its coefficient of kinetic friction =  $\mu_k$ ). The blocks are connected by a string of negligible mass that remains taut at all times. Analyze all forces on each block.

*FBD of  $m_1$*

*coord. axes*

*x-analysis*

*y-analysis*

*FBD of  $m_2$*

*coord. axes*

*x-analysis*

*y-analysis*

**EXERCISE II:** Blocks  $m_1$  and  $m_2$  are not attached to one another, but they are accelerating together to the right on a level surface that has friction (its coefficient of kinetic friction =  $\mu_k$ ). There is static friction between the two blocks (its coefficient of static friction =  $\mu_s$ ). Analyze all forces on each block.

*FBD of  $m_1$*

*coord. axes*

*x-analysis*

*y-analysis*

*FBD of  $m_2$*

*coord. axes*

*x-analysis*

*y-analysis*

**EXERCISE 12:** Masses  $m_1$  and  $m_2$  are not attached to one another, but they are at rest in the positions shown. The level floor and the vertical wall have static friction coefficients  $\mu_{s1}$  and  $\mu_{s2}$ , respectively. There is also static friction (coefficient =  $\mu_{s3}$ ) between the two masses. Analyze all forces on each mass.

*FBD of  $m_1$*

*coord. axes*

*x-analysis*

*y-analysis*

*FBD of  $m_2$*

*coord. axes*

*x-analysis*

*y-analysis*

**EXERCISE 13:** The block with mass  $m$  is at rest on the incline, which offers static friction (coefficient =  $\mu_s$ ). Analyze all forces on the block.

*FBD of  $m$*

*coord. axes*

*x-analysis*

*y-analysis*

**EXERCISE 14:** The block ( $m$ ) is accelerating down the frictionless inclined surface. Analyze all forces on the block.

*FBD of  $m$*

*coord. axes*

*x-analysis*

*y-analysis*

**EXERCISE 15:** The block with mass  $m$  is moving up the frictionless incline at a constant velocity. The force  $F$  is horizontal. Analyze all forces on the block.

*coord. axes*

*FBD of m*

*x-analysis*

*y-analysis*

**EXERCISE 16:** The block ( $m$ ) is accelerating up the inclined surface. The coefficient of kinetic friction between the block and the incline is  $\mu_k$ . Analyze all forces on the block.

*coord. axes*

*FBD of m*

*x-analysis*

*y-analysis*

**EXERCISE 17:** Blocks with masses  $m_1$  and  $m_2$  are connected by a string (with negligible mass) that passes over a frictionless pulley. The coefficient of kinetic friction between  $m_2$  and the incline is  $\mu_k$ . The masses are accelerating as one unit—the string is taut at all times. Analyze all forces on each mass.

*FBD of  $m_1$*

*coord. axes*

*x-analysis*

*y-analysis*

*FBD of  $m_2$*
